

**OmniCell Communications...A World Apart**

## **Digital Antenna Direct-Connect ‘Bag Kit’**

A direct-connect amplifier system is an installation with one antenna (usually on the roof of a vehicle, the window of a hotel room, or outdoors in an office or home situation). The amplifier is connected to the cellular device by means of an ‘antenna adapter cable’ (plugged into the antenna port on the handset or wireless modem), or by using the small, universal adapter cable (with the Velcro patch).

In most cases, it is best to use the ‘plug in’ style adapter cable if one is available for your cellular device. The physical connection provides a much better contact with the antenna system of your device. If, though, your device is not made to accept this type of connector, the universal adapter will provide a much better signal than if you were not using the amplifier at all.

### **Kit Contents...**

*Digital Antenna PowerMax DA4000 Direct-Connect Amplifier*  
*Digital Antenna CA55M 3½ Mag-Mount Antenna*  
*2’ Extension Cable*  
*Antenna Adapter Cable\* or Universal Adapter Cable*  
*DC Power Cable with Cigarette Lighter Adapter*  
*AC Power 120v Power Adapter*  
*Soft Carry Case for Amplifier Protection*

*\*Must order for specific cellular device*
